ELEKTRON WE43 is a high strength magnesium based casting alloy developed and patented by Magnesium Elektron for use at temperatures up to 200°C. This alloy system maintains its good mechanical properties at elevated temperatures, without the use of either silver or thorium. The alloy is stable for long term exposure up to 250°C.

ELEKTRON WE43 has excellent corrosion resistance characteristics.

APPLICATIONS

The excellent retention of properties at elevated temperatures will be of interest to designers of aeroengines and other power systems, helicopter transmissions, missiles, racing and high performance cars.

OTHER PROPERTIES

CASTABILITY

Fine grained and pressure tight with good casting characteristics.

PATTERN MAKERS SHRINKAGE FACTOR

1.5%

WELDABILITY

Fully weldable by the tungsten arc inert gas (TIG) process, using filler rods of the parent alloy composition.

MACHINING

ELEKTRON WE43 castings, like all magnesium alloy castings, machine faster than any other metal. Providing the geometry of the part allows, the limiting factor is the power and speed of the machine rather than the quality of the tool material. The power required per cubic centimetre of metal removed varies from 9 to 14 watts per minute depending on the operation.

SURFACE TREATMENT

Normal protective treatments apply for ELEKTRON WE43 but some chromating baths may need to be modified for the satisfactory treatment of castings.
